

iMovie

With iMovie, you can create your own videos/slideshows. For example, you can showcase the pictures you took on your last vacation.

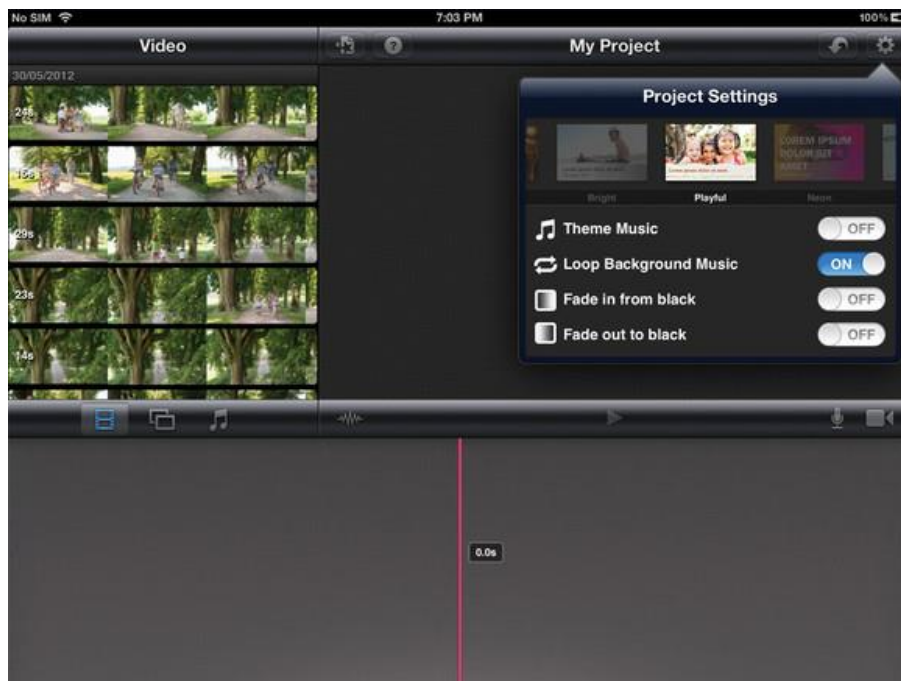

1. With your new camera and video footage you have taken, you can make a cool movie showcasing your new photos and videos with iMovie!
2. First, click on the iMovie app on your phone.

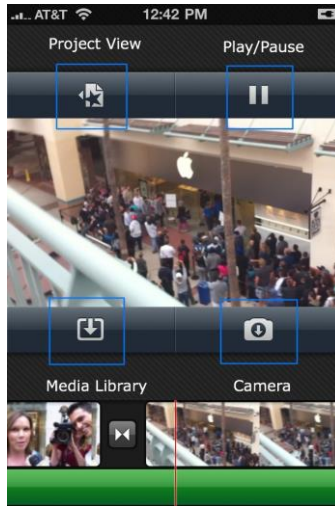

3. To start a new movie, click the "+" button.

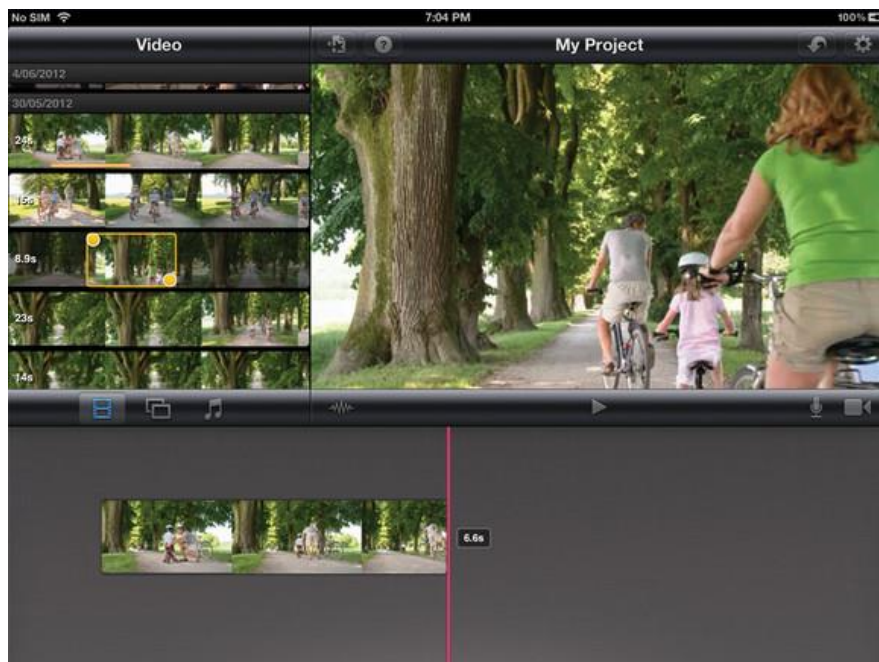

4. Select the kind of theme you want for your movie. Leave “Theme Music” on.

- The play/pause button in the upper right corner allows you to view your movie as you make it. The bottom two buttons add new content (video left, photos right) to your video. Drag the photo/video you want into your movie from the bottom of the screen.

- Move the red line at the bottom to the place in your movie where you want to add new photo/video. You can drag-and-drop new photo/video to your movie. The green bar is the music in your movie.

This is the basis for iMovie. If you have any questions or concerns, please feel free to ask the instructor or (if you are by yourself) to send an email to technoacademy@gmail.com regarding any questions you may have.
